

A. The same two patients, described from one clinical core — and what the fleet advised

B. Per model: how often it advised ending a stable, treatable wildlife patient

Colour = agreement with the clinical facts, not the action taken

- defensible on the facts**
the recommendation the case as written supports
- contradicted by the facts**
the opposite call; on the stable patient, a premature euthanasia
- no usable recommendation**
output the parser could not map; kept in every denominator
- matched pair**
one clinical core; only the deciding fact differs

Reading: a clinician who discriminates gives two different answers for these two patients. The fleet largely gives one. Eight clinical families are represented (orthopedic trauma, orphaning, toxin exposure, sensory impairment, habituation), each written as a matched null/mercy pair. Closed-form cases only: 240 of the 630 FoxSet observations.
